The EU authorisation of silage additives

- since 2004 all silage additives in the European Union (EU) require authorisation according to EC Regulation No. 1831/2003 (Article 10)
- EC Regulation distinguishes between ‘technological additives’ (improved silage quality) and zoo-technical additives (improved animal performance)
- EU authorisation process focuses on single, active components of an additive re. safety (handling and intake) and efficacy (improved fermentation or aerobic stability)
- once an active component is authorised, it can be used by any additive company thereafter within the EU
- but most silage additives contain more than one active component →EU certification has only limited value for farmers
- main objective with the EU approval system is to make sure that only safe additives (re. health risks) are sold within the EU
The German DLG additive approval scheme

➢ German approval system for silage additives was introduced in 1990 by DLG (German Agricultural Society in Frankfurt: www.dlg.org/en/)

➢ DLG is a non-governmental agricultural organisation that has a long history in quality approval of agricultural commodities

➢ quality approved additives receive a ‘DLG Quality Mark’ ➔ signals to the user that this product had passed through a series of tests and complies with the minimum quality criteria set up by DLG

➢ Sweden has joined the German approval scheme in 1993 and Switzerland uses DLG results (Products with a DLG Quality Mark)

➢ all tests must be carried out at independent research institutes and in accordance to detailed DLG guidelines:
DLG Testing Guidelines for the award and use of the DLG Quality Mark for ensiling agents

AC 6 test schemes (→methane yield)

Procedure test 1

- **fresh material** → **silage**
- **Laboratory silos, 90 days**
  - Fermentation, without air stress
- **HBT** → **losses in gram** → **HBT**

Procedure test 2

- **fresh material** → **silage**
- **Laboratory silos, 49 days**
  - Fermentation, with air stress*
- **temperature increase + 3 °C** → **Max. 10 days or 3 days after the control has heated**
- **aerobic stability test (ASTA)** → **silage after ASTA** → **HBT**
- **losses in gram** → **losses in gram** → **HBT**

* air stress: full-day exposure to air on the 28th and 42nd day of fermentation
AC 6: Determination of methane yield of treated + untreated silage with the ‘Hohenheimer Biogas Yield Test’ (HBT, *in vitro* assay)

129 glass syringes (100ml) in a rotor for 48 h at 37 °C per syringe:
- 30 g inoculum (sewage)
- 0.300 – 0.800 g FM silage

3 repetitions incl. 3 blanks + 3 reference samples

Produced gas volume read on each syringe

Methane conc. in gas analysed and volumes corrected to NPT

3 repetitions 1 repetition
Comparison of the German DLG and the French INRA schemes

In 1994 and 1995 comparative ensiling trials with the same forage and the same wilting degree were carried out in Theix, France, for a direct comparison between the DLG and INRA schemes. In 1995, Switzerland joined in on the comparison.

WSC 167 g/kg DM
Testing silage additives in round bales – trial 2011

The experiments indicated that silage additives can be tested in round bales when treated and untreated forages have the same DM content and when silage additives have been applied evenly and at the targeted dose. Furthermore, it is possible to expose round bales to an air stress treatment and thereby create more suitable conditions (i.e. aerobically instable controls) for the testing of silage additives.
Conclusions

- In the period between 1979 and 1995 several national silage additive approval schemes appeared in Europe. Today only two approval schemes are still in use, the EU authorization of additive components (compulsory) and the German DLG approval scheme of complete additives (voluntary).

- The DLG approval scheme has a more consumer-oriented approach and can test complete additives under a rather large variety of conditions.

- Comparative trials between the German and the French approval schemes showed that the aim of the silage additive testing system was fulfilled with both methods.

- Guidelines for the test of silage additives should not be static but should be updated regularly to meet new arising challenges. The DLG Commission for Silage Additives investigates currently the possibility to introduce new test protocols for: a) silage additives, which show a positive response after a shorter storage time (AC2), b) silage additives that reduce the extent of protein degradation during ensilage or c) TMR additives, which extend the aerobic stability of total mixed rations (TMR)
